

# Upgrading MARS

MARS is regularly updated to introduce new features and address known or reported bugs. These updates are released as new versions or new builds of the latest version. MARS users are strongly recommended to install the latest build to make sure they are up to date with bug fixes and can enjoy the new features. Please note that full information on the changes in each build is available in the product history section of our website. This document is to help you understand the MARS upgrade process.

## *Upgrading to the latest build*

To install a new build, simply download the latest build from the Member Area and double click on the setup file to start the installation process. You **do not** need to uninstall the old build first as this is handled by the installation process.

The MARS upgrade process preserves your schedules and configuration. To ensure this, please read carefully the information in each step of the installation process and make sure you select the **same installation path** as the old installation when prompted.

You may be prompted to enter to enter your Licence details. You can see these online by logging into Black Box from the Member Area.
